# **Probability Intro**

**GA DAT3** 

## Agenda

Definition

Bayes' Rule

Continuous Probability

Super important distributions

- Sample space Ω: The set of all the outcomes of a random experiment. Here, each outcome
   ω ∈ Ω can be thought of as a complete description of the state of the real world at the end
   of the experiment.
  - Set of events (or event space) F: A set whose elements A ∈ F (called events) are subsets of Ω (i.e. A ⊆ Ω is a collection of possible outcomes of an experiment) 1
  - of  $\Omega$  (i.e.,  $A \subseteq \Omega$  is a collection of possible outcomes of an experiment).<sup>1</sup>.
  - Probability measure: A function P: F → R that satisfies the following properties,
  - P(A) ≥ 0, for all A ∈ F
     P(Ω) = 1
  - If  $A_1, A_2, \ldots$  are disjoint events (i.e.,  $A_i \cap A_j = \emptyset$  whenever  $i \neq j$ ), then

$$P(\cup_i A_i) = \sum_i P(A_i)$$

What are the **sample space** 

e.g. die rolling

and event space?

### Sample vs event space with a k-sided die:

- sample: { 1...6 }
- event: "odd" {1, 3, 5 }
- Random variable e.g. "sum of the numbers"

Given two events, A and B, we define the probability of A or B as follows:

$$p(A \lor B) = p(A) + p(B) - p(A \land B)$$
  
=  $p(A) + p(B)$  if  $A$  and  $B$  are mutually exclusive

$$p(A, B) = p(A \wedge B) = p(A|B)p(B)$$

## marginal

$$p(A) = \sum_{b} p(A, B) = \sum_{b} p(A|B = b)p(B = b)$$

## product rule (= joint)

$$p(X_{1:D}) = p(X_1)p(X_2|X_1)p(X_3|X_2, X_1)p(X_4|X_1, X_2, X_3) \dots p(X_D|X_{1:D-1})$$

#### Bayes' Rule

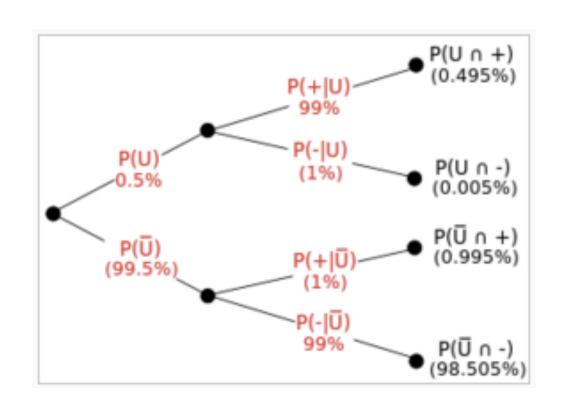

Suppose a drug test is 99% sensitive and 99% specific. That is, the test will produce 99% true positive results for drug users and 99% true negative results for non-drug users. Suppose that 0.5% of people are users of the drug. If a randomly selected individual tests positive, what is the probability he or she is a user?

$$P(\text{User} \mid +) = \frac{P(+ \mid \text{User})P(\text{User})}{P(+ \mid \text{User})P(\text{User}) + P(+ \mid \text{Non-user})P(\text{Non-user})}$$

$$= \frac{0.99 \times 0.005}{0.99 \times 0.005 + 0.01 \times 0.995}$$

$$\approx 33.2\%$$

#### Baye's Rule

(conditional) independence

$$X \perp Y|Z \iff p(X,Y|Z) = p(X|Z)p(Y|Z)$$

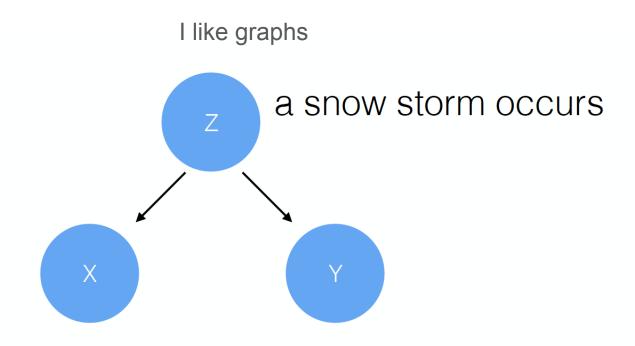

very fun (easy-ish) challenge - prove this:

**Theorem 2.2.1.**  $X \perp Y | Z$  iff there exist function g and h such that

$$p(x, y|z) = g(x, z)h(y, z)$$

for all x, y, z such that p(z) > 0.

conditional independence: example

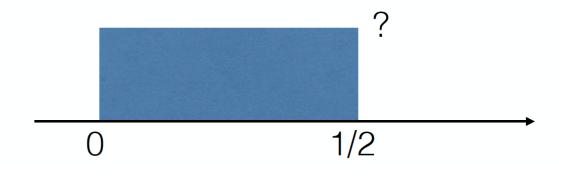

Bob gets home late

Alice gets home late

#### **Continuous Probability**

$$P(a < X \le b) = \int_{a}^{b} f(x)dx$$

weird stuff - what goes on here?

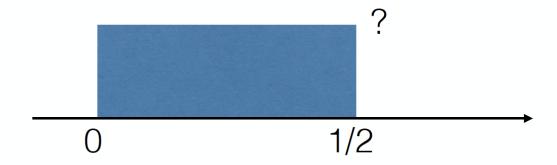

#### **Continuous Probability**

$$P(a < X \le b) = \int_{a}^{b} f(x)dx$$

$$\mathrm{Unif}(x|a,b) = \frac{1}{b-a} \mathbb{I}(a \le x \le b)$$

If we set a=0 and  $b=\frac{1}{2}$ , we have p(x)=2 for any  $x\in[0,\frac{1}{2}]$ 

Mean, Variance, Covariance

$$E[X] = ?$$

$$\operatorname{var}\left[X\right] \triangleq \mathbb{E}\left[(X-\mu)^2\right] = \int (x-\mu)^2 p(x) dx$$
$$= \int x^2 p(x) dx + \mu^2 \int p(x) dx - 2\mu \int x p(x) dx = \mathbb{E}\left[X^2\right] - \mu^2$$

$$\operatorname{cov}\left[X,Y\right] \triangleq \mathbb{E}\left[\left(X - \mathbb{E}\left[X\right]\right)\left(Y - \mathbb{E}\left[Y\right]\right)\right] = \mathbb{E}\left[XY\right] - \mathbb{E}\left[X\right]\mathbb{E}\left[Y\right]$$

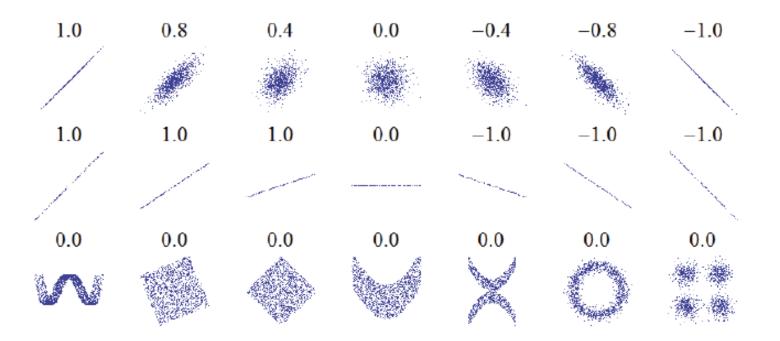

Figure 2.12 Several sets of (x,y) points, with the correlation coefficient of x and y for each set. Note that the correlation reflects the noisiness and direction of a linear relationship (top row), but not the slope of that relationship (middle), nor many aspects of nonlinear relationships (bottom). N.B.: the figure in the center has a slope of 0 but in that case the correlation coefficient is undefined because the variance of Y is zero. #### Super important distributions - Bernoulli, Binomial

$$Ber(x|\theta) = \theta^{\mathbb{I}(x=1)} (1-\theta)^{\mathbb{I}(x=0)}$$

In other words,

$$Ber(x|\theta) = \begin{cases} \theta & \text{if } x = 1\\ 1 - \theta & \text{if } x = 0 \end{cases}$$

$$\operatorname{Bin}(k|n,\theta) \triangleq \binom{n}{k} \theta^k (1-\theta)^{n-k}$$

where

$$\binom{n}{k} \triangleq \frac{n!}{(n-k)!k!}$$

examples?

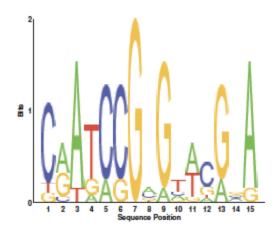

#### Super important distributions - Multinoulli

$$\operatorname{Mu}(\mathbf{x}|n,\theta) \triangleq \binom{n}{x_1 \dots x_K} \prod_{j=1}^K \theta_j^{x_j}$$

where  $\theta_i$  is the probability that side j shows up, and

$$\binom{n}{x_1 \dots x_K} \triangleq \frac{n!}{x_1! x_2! \dots x_K!}$$

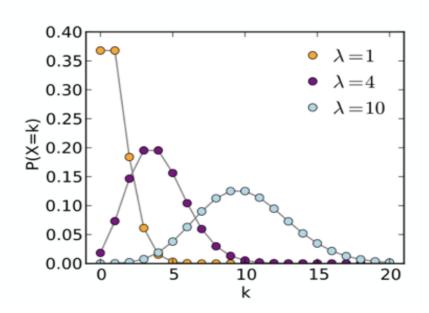

a t a g c c g g t a c g g c a t a g c t g c a a c c g c a t c a g c c a t c a g a g c a t c a g c c a c t a g a g c a a t a a c c g c g c a t a a g c c g c t a a g g t a t a a g c c g t t a c g g c c a t a t c c g g t a c a g t a a c a g c a a a c a t c c g t g a c g g a a a c a t c c g t g a c g g a a

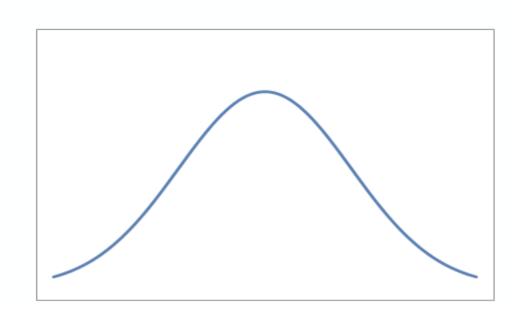

#### Super important distributions - Poisson, Gaussian

$$Poi(x|\lambda) = e^{-\lambda} \frac{\lambda^x}{x!}$$

$$\mathcal{N}(x|\mu,\sigma^2) \triangleq \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{1}{2\sigma^2}(x-\mu)^2}$$

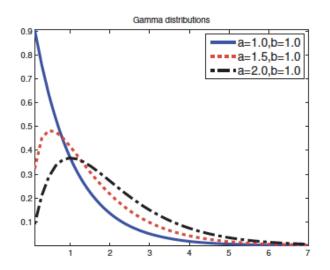

#### Super important distributions - Gamma, Beta

$$Ga(T|\text{shape} = a, \text{rate} = b) \triangleq \frac{b^a}{\Gamma(a)} T^{a-1} e^{-Tb}$$

where  $\Gamma(a)$  is the gamma function:

$$\Gamma(x) \triangleq \int_0^\infty u^{x-1} e^{-u} du$$

Beta
$$(x|a,b) = \frac{1}{B(a,b)}x^{a-1}(1-x)^{b-1}$$

Here B(p,q) is the beta function,

$$B(a,b) \triangleq \frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)}$$
